## Original.

### SOMATOSE AS A TONIC.

A complaint frequently made with regard to meat preparations is that they destroy the appetite, which is usually more or less impaired in conditions of disease, and that when administered for some time they become extremely repugnant to the patient. This must be considered as a serious disadvantage, for it is not enough that a food shall contain a large quantity of nutritive elements, it must also be palatable and exert no disturbing effect upon the digestive apparatus. Somatose differs from all other meat preparations in that it stimulates the appetite and never cloyes upon the palate. It is not only an ideal nutrient *per se*, but awakens the desire for other foods, so as to be well adapted for alimentation in chronic diseases. As it is odorless and practically tasteless it may be administered to sensitive and fastidious patients without their knowledge. Somatose contains the albuminous principles of meat in a form most favorable for immediate absorption and assimilation, and for this reason its administration is rapidly followed by an increase in strength and vital activity—a genuine tonic effect. Attention has been called by Professor Bartley that somatose exerts a direct nutrient action upon the heart muscles, and he explains its effect upon the digestive organs in the same way, i. e., by its furnishing nourishment to the mucous membrane of the stomach. Thompson has found that in cases of typhoid fever attended with great

irritability of the stomach, somatose was well tolerated when other foods were rejected, and he ascribes this to a sedative influence upon the hyperesthetic gastric mucous membrane. The advantages of somatose over other meat preparations may be briefly summarized as follows: 1. It consists of albuminous elements in a form most available for immediate absorption and assimilation, that is in the form of albumoses. 2. It is tasteless, odorless and readily soluble in fluid foods. 3. It stimulates the appetite and enables the patient to dispose of a larger amount of other foods. 4. It has a soothing effect upon the inflamed and hyperesthetic mucous membrane of the digestive tracts. 5. Owing to the high degree of concentration of its albuminous constituents small doses are as effective as much larger quantities of other food products, also rendering it less expensive than the latter.

### AN EFFICIENT ANTI-PRURITIC.

Aside from its value as an antiseptic and antimycotic in parasitic affections of the skin, and as a stimulant in chronic dermatoses, losophan has been shown to possess decided anti-pruritic properties. It is, therefore, deserving of a trial in chronic cutaneous diseases attended with marked itching, such as prurigo, pruritus ani and vulve, some cases of chronic eczema, etc. The itching in these cases is sometimes so intense as to rob the patient of his night's rest, and even to make life a burden.

Descottes has reported a case of pruritus in which after other remedies had been tried in vain the distressing itching was relieved by an ointment of losophan. Waugh mentions several cases of pruritus ani and vulvae in which a like favorable result followed the use of a 3 per cent. ointment, although previous treatment has been unsuccessful. Saalfeld also recommends its employment in prurigo and pruritus. The results to be obtained from losophan, however, depend to a great extent upon the method of preparation of the ointments. It should always be thoroughly dissolved in oil before being added to the ointment base. It is rarely necessary to exceed the strength of 5 per cent.; and finally it should not be employed in acute cases attended with marked cutaneous irritation.

#### CAPE MAY AS A HEALTH RESORT.

BY ALBERT E. ROUSSEL, M. D.,

Assistant Professor of Practice and Clinical Medicine, Medico-Chirurgical College; Consulting Physician to the Temporary Home; Visiting Physician to the Howard Hospital.

As a summer resident of Cape May for some ten successive years I have had a fairly-good opportunity of judging of its merits as a health resort, more particularly during the summer months.

During this period of time I have been especially impressed by the marked improvement manifested in that very large group of cases that are presumably benefited by a seashore sojourn.

Curiously, however, there has undoubtedly existed a rather wide spread impression that the relative humidity at this resort was higher than at some of its more populous rivals.

With the object of obtaining some definite data upon this subject I wrote for and procured the following interesting table from the Chief of the Weather Bureau at Washington.

As will be noticed from the table,

the relative annual percentage of humidity is but 77, as compared with 80 for Atlantic City, and no one monthly average proves an exception to this general rule.

A study of the temperature-record is equally interesting. Although the mean annual temperature of Cape May is one and a fraction degrees higher than that of Atlantic City, yet it will be noted that the relative difference is but slightly marked during the summer and autumn months, but, on the contrary, is the most pronounced during the remaining portion of the year, which would only tend to emphasize the advantages of the Cape throughout the entire year.

This is especially true when we take into consideration the prevailing direction of the wind—a point of no little importance during the summer season. On account of its insular position, the unwelcome land-breeze is a rare visitor, indeed, a direct northwest wind being alone responsible for its production.

Then, again, the manifest superiority of the magnificent beach, the absence of the particular crowds occasioned by cheap excursions, and last, but not least, the cleanly and well-kept streets must certainly appeal to those who seek health as well as recreation.

## TREATMENT OF SPRAINED ANKLES.

The earlier treatment of sprained ankles was not characterized by very direct methods, hence results were very frequently disappointing. The interpretation of the element of rest was oftentimes very poorly made, while a truthful history of the manner and force of infliction did not appear to figure very largely as a guiding element of treatment, hence these methods adopted were often productive of further diseased conditions. Upon the introduction of well-considered immobilization and a just interpretation of the real force and utility of imposed rest results became more uniform. With plaster of paris splints, the starch bandage and the adhesive plaster treatment of Gibney, the surgeon is certainly well equipped with requisite and efficient means. A truthful history and a proper determination of the actual condition as presented in a sprained joint is of paramount importance; the extent of contusion of a joint, whether ligaments or tendons are strained and ruptured, enter largely into treatment and prognosis. To those not having tried Gibney's adhesive plaster treatment, they will find that in many cases it is a successful, easy and comfortable means of treatment. Its ease and

facility of application and satisfactory accomplishment makes a thoroughly desirable method of treatment. It successfully gives "an equable support to tendons and ligaments about the ankle joint, which results in the resolution of all effusion." In severely contused joints, more or less inflammatory states will have to be combated and nothing in our conception is equal to judicious massage of the parts used, of course, along with immobilization. We can well remember following, for the first time in treating a sprained ankle, the suggestion of Florence Nightingale, which was to rub on and about the sprained ankle joint a tablespoonful of warm lard, no more nor no less, but a tablespoonful, must be "rubbed in." To that benighted individual who has never tried it, it remains then for him to realize that a tablespoonful, under these conditions, seems as large as a bushel when he tries to rub it in himself. At that time this treatment was in many cases as efficient as any, which, of course, was owing entirely to the complete massaging the joint received, which seemed to prevent engorgement of blood vessels and the consequent capillary activity resulted in absorption of effusion. We believe that in many ankle sprains massage is as competent to obtain good results as can be obtained in immobilization, and in a much shorter space of time. The immediate application of massage in many of these cases will cause an unusually rapid absorption of effusion and a quick return of parts to normal condition.

The rubbing of a tablespoonful of warm lard on parts is no contemptible gauge of the requisite quantity of massage demanded, as we well know the lard has no virtue aside from the fact of ease of manipulation. Even with the perfection in result as obtained by proper immobilization, massage is destined to assume an important role in the treatment not only of sprained ankle, but other traumatized joints, for it occupies the cure of those conditions between a pure process of repair as represented in delitescence and fixed inflammatory effusion.—Railway Surgeon.

### THE ENDEAVOR OF THE UNITED STATES WEATHER BUREAU TO INVESTIGATE THE INFLUENCE OF CLIMATE ON HEALTH.

The commendatory efforts of the National Weather Bureau in compiling statistics regarding the influence of storms and cold and heat waves on the mortality and causation of disease is being pushed as fast as a new experiment can be.

The assistance which may be given this Bureau by local boards of health and others is very great, and the results will be of inestimable value if due interest is taken in the project.

We are inclined to believe that there is more influence in storms and in heat and cold waves upon disease and the causation of diseases than is commonly supposed, and the following extracts from the March circular, sent out by the Weather Bureau, will inform our readers of the methods used in compiling these reports:

"The vital and meteorologic statistics, having been received, will be collated by general averages and by particular and selected events, as the comparison of the general mortality with the average conditions of the weather for the week, and the passage of storms and cold or hot waves, the appearance of epidemics, etc. Also, in instances as well-defined weather disturbances, comparisons of vital and meteorologic statistics will be made by daily periods. For example, a storm appearing in the western part of the country will be followed day by day as it passes eastward across the country, and the illness and deaths reported for these days from the localities traversed will be compiled and compared with the same kind of facts reported both before and after the storm. The same plan of treatment will be pursued in dealing with hot and cold waves.

"By these methods we may hope to be able to give, in time, definite information as to how much and how the accidental and constant variations of the weather affect the sick and well, and in what way the present forecasts and weather charts can be used in both curative and preventive medicine.

"The calendar week has been adopted as the period of time for collecting statistics and making the general comparison; because in longer periods, for instance a month, the evidence of extreme fluctuations in either the meteorologic or sanitary conditions is more or less smoothed out in proportion to the length of time during which the events happened. Also, because it has the advantage over other short arbitrary periods in being familiar to all, and one by which so many of our ordinary events and actions are reckoned.

"A publication containing the collected and compiled facts will be issued monthly. This publication will comprise, in the shape of tables, charts and diagrams, the chief meteorologic factors as observed and recorded by the officials of the Weather Bureau, and the statistics of mortality and morbidity as reported by the various public health offi-

cials and by individual physicians; also brief statements of the general sanitary conditions of the different localities, especially as they may have been influenced by the weather.

"Under no circumstances will discriminating or advisory notices of any locality be published, the entire aim of the Bureau being to collect the facts and statistics for the sanitary and medical profession, and for the general public, to use in such ways and for such purposes as they may see fit."

#### SOMETHING NEW AND GOOD.

We have at hand one of the most desirable fountain syringes that we have ever seen. While the idea is not entirely new it certainly has been carried out in the manufacture of this instrument with the greatest success ever attained.

The suggestive name of this instrument is "The King," and once seen its immense advantage over the ordinary fountain syringe is at once apparent.

The reservoir of this syringe is made to hold a gallon of water, is of rubber similar to other fountain syringes, but on the front of the bag is sealed a good-size thermometer, regulated to indicate the number of degrees temperature of the water contained in the bag. This will obviate the ill effects one may obtain from too hot or too cold water when using injections.

Another admirable thing in connection with this instrument is the plainly-printed directions on the front of the bag. These indicate the necessary temperature to use with children and adults. The only caution given in the use of this syringe is with reference to cracking the thermometer with too hot water. By placing two cupfuls of cold water in the bag first the hot water may then be added without danger of hurting the instrument.

The cost of this syringe is the same as that of other similar kinds, plus price of thermometer, or \$2.25 retail.

The manufacturers (Charles R. Parmelee Co., 98 William street, New York) state that only one size is

made, viz., one gallon, and this is an advantage, for in the treatment of many conditions where hot water syringing is of value there is a tendency to use too little water.

We wish success to the enterprising firm that puts on the market such a beneficial instrument as this.

#### THE PERENNIAL VALUE OF AN OLD DIPLOMA.

The question as to what becomes of the old diplomas finds a partial answer in the following advertisement, which appeared a short time ago in a Buffalo daily paper.

"For Sale.—A physician's diploma from one of the best colleges in the country. Address Medical News office."

A valued correspondent wrote to the address given and received a reply which we now have. From this we learn that the advertiser is a graduate of nearly 20 years' standing from a reputable medical college in this State, a physician in regular practice in a small town not far from Buffalo, a member of his county society, and presumably regarded as a respectable member of the community in which he lives. How his neighbors are deceived, if this is the opinion they hold of him, may be learned from his own words. He writes:

"The diploma in question was issued by the Castleton, Vt., Medical College to my father, who died a few years ago, is on sheepskin and is in first-class condition. The name and date you can have changed if you wish, but where a man travels away from home it is only customary to change the date, and that is not always done.

"My price for the diploma is \$25.

"Of course it is needless for me to say anything about the ease with which money can be made in the practice of medicine if one goes about it rightly. I would advise anyone following the line of travel and advertise, staying from two to three weeks in a place. One can make from \$25 to \$100 a week. If you should wish to see me personally you

can come to — and return home in a few hours."

And this from a physician, the son of a physician, a member in good standing of the Genesee (N. Y.) County Medical Society! We should advise this man, who respects his father's name as little as he does the honor of his profession, to follow his own counsel and "travel" away from the company of respectable physicians. His letter, which we have in our possession, is at the disposal of the proper authorities who may wish to learn the fate of this particular diploma.—

Reprinted from the New Orleans Med. and Surg. Journal.

### ANNUAL REPORTS OF THE MANAGERS AND OFFICERS OF THE STATE HOSPITALS OF NEW JERSEY FOR THE YEAR ENDING OCTOBER 31, 1894.

## Correspondence.

Brodnax, La., June 11, '95.  
Editor "Times and Register."

Dr. O. D. Norton, of Cincinnati, O., sends me your May issue, in which

on page 432 is an article "Turpentine as a Hemostatic."

Forty-five years ago in Augusta, Ga., Dr. O. H. Munson, an old dentist, pulled a tooth for me. It bled so freely that it ran almost in a stream from my mouth. "That won't do," said he, "here;" and he wet a piece of cotton with turpentine, forced it down into the cavity and held it there for five minutes with his finger. The bleeding stopped. I kept the cotton in place all day for fear of a return. We old timers don't like to see the young fellows run away with remedies of over a half century of regular use. Tell our friend Dr. Sasse, he should read some of the old books of 1832 to 1843.

Yours very truly,  
BEN H. BRODNAX.

## Miscellany.

### WILL IT BE CONSIDERED DANGEROUS TO WEAR CLOTHING?

The following is extracted from the June 13 issue of the Boston Medical and Surgical Journal:

"Dr. Leitz, of Munich, according to La Médecine Moderne, has found that a little disc three millimetres in diameter, which has been placed upon a woolen stocking which has been worn, produced 356 colonies on nutrient gelatin. A cotton stocking gave 712 colonies. From a glove which had not been worn, 33 colonies were obtained. Among the colonies there are always a few pathogenic bacteria, the staphylococcus pyogenes albus being the commonest. Leitz has found the typhoid bacillus in clothing after 21 and 26 days; the anthrax bacillus obtained from cloth was virulent at the end of a year. An encouraging fact was that the linen of tubercular patients after profuse night-sweats, did not apparently contain the tubercle bacillus; the results of inoculation were negative."

### MUSIC FOR THE SICK POOR OF PARIS.

A French gentleman, M. Guzman, has left 50,000 francs to the Assistance Publique, the Paris Municipal Charity Department, to defray the cost of musical entertainments to be given to the sick poor in the hospitals and asylums under its control.—Boston Medical and Surgical Journal.

### A NEW SIGN IN AUSCULTATION OF THE CHEST.

BY L. F. ALVAREZ, M. D.

At a meeting of the Second Mexican Medical Congress, held in San Luis Potosi, from the 8th to the 10th of last November, Professor Carmona y Valle read a paper on a new sign in auscultation of the chest not mentioned by any writer on physical diagnosis. For over 20 years Professor Carmona y Valle has called the attention of his students to this sign, which consists in a modification of the voice perceived on auscultating the chest at the level of a pleuritic effusion when the patient speaks. The voice is not confused as in the normal state, but clear and more acute than the voice of the person who produced it, and it appears to come from a distance, though located within the chest; it is not vacillating nor tremulous, and this is what distinguishes this sign from egophony. As in egophony the transmitting medium is liquid and not air, as is the case normally.

Professor Carmona y Valle formerly compared this modification of the voice to the sound produced by the cornet when played with the key used to subdue its sound, but since he became acquainted with the telephone he believes that it resembles the timbre of the voice transmitted by that apparatus, hence he calls this the telephonic voice. He believes this sign is of great value in the diagnosis of pleuritic effusion, because, besides being constant in all of them, it is not present in cases where there is no liquid in the pleural cavity. It is of great service in distinguishing pleuritic effusions from pulmonary affections, such as edema of the lungs

and intra-thoracic new growths, which, like pleuritic effusions, produce dullness and absence from thoracic vibrations on palpation.

He mentioned two cases in which the constant absence of the telephonic voice led to the exclusion of pleuritic effusion and to the diagnosis of pleuro-pulmonary tumor, and in both cases at the autopsy a large sarcoma was found.—Pacific Medical Journal.

Do you want a vacation that will be perfection in every respect? If you do you should select one of the famous resorts in northern and eastern New England. Every principal summer resort is reached by the Boston & Maine Railroad. If the mountains are your choice you can surely find an agreeable and comfortable abode for the summer at the White Mountains, while no more healthful or delightful beaches can be found than those scattered along the North Shore, from Boston to the Provincees.

There are abundant opportunities for surf bathing, for yachting, for fishing and for a general good time, while hostelries, superbly equipped, are to be found at every hand.

The summer season opened with the Boston & Maine on June 1, and upon inquiry at any ticket office of the company you will find that excursion tickets may be purchased at reduced rates for every one of the more prominent points in New England. Excursion books, giving routes, rates, hotel and boarding house list, will be mailed free by passenger department, Boston & Maine Railroad, Boston.

### DISTURBANCES OF INNERVATION.

Robert B. McCall, M. D., Medical College of Ohio, Cincinnati, now residing at Hamersville, O., writes:

"My confidence in antikamnia is so well established that I have only words of praise. Independently of other observers I have proved to my satisfaction its certain value as a promoter of parturition, whether typical, delayed or complicated, and

can come to — and return home in a few hours."

And this from a physician, the son of a physician, a member in good standing of the Genesee (N. Y.) County Medical Society! We should advise this man, who respects his father's name as little as he does the honor of his profession, to follow his own counsel and "travel" away from the company of respectable physicians. His letter, which we have in our possession, is at the disposal of the proper authorities who may wish to learn the fate of this particular diploma.—New York Medical Record.

Excursion books, giving routes, rates, hotel and boarding house list, will be mailed free by passenger department, Boston & Maine Railroad, Boston.

## DISTURBANCES OF INNERVATION.

Robert B. McCall, M. D., Medical College of Ohio, Cincinnati, now residing at Hamersville, O., writes:

"My confidence in antikamnia is so well established that I have only words of praise. Independently of other observers I have proved to my satisfaction its certain value as a promoter of parturition, whether typical, delayed or complicated, and

its effectiveness in controlling the vomiting of pregnancy. In cases marked by unusual suffering in second stage, pains of nagging sort, frequent or separated by prolonged intervals, accompanied by nervous rigors and mental forebodings, one or two doses, three to five grains each, of antikamnia promptly changes all this.

"If there is a 'sleepy uterus' antikamnia and quinine awake every energy, muscular and nervous, and push labor to an early safe conclusion. Indeed, in any case of labor small doses are helpful, confirming efforts of nature and shortening duration of process.

"I have just finished treatment of an obstinate case of vomiting in pregnancy. A week ago the first dose of antikamnia was given, nervous excitement, mental worry and gastric intolerance rapidly yielded. This case was a typical one and the result is clearly attributable to the masterful influence of your preparation.

"If there is any one drug or preparation that can be made to answer every need of the physician, for the correction of the multitudinous disturbances of innervation that occur in the various diseases he is called upon to treat, that one is antikamnia."

Dr. Welch, the bacteriologist for Johns Hopkins Hospital, has demonstrated that germs will not grow in the immediate vicinity of silver. A sterilized silver wire was introduced into a culture, and while the colonies grew as usual elsewhere, immediately about the wire was free from them. Drs. Halsted and Kelly are making use of this discovery by using silver foil in the dressing of aseptic surgical wounds. The foil is placed immediately in contact with the closed incision in sheets about four inches square, and then the other aseptic dressings are applied.—College and Clinical Record.

#### THE TREATMENT OF FRACTURE OF THE RADIUS.

Hennequin summarizes the conclusion of his study of this subject in

the *Revue de Chirurgie*, No. 9, 1894, as follows:

1. That it is necessary to reduce the fracture of the lower extremity of the radius.

2. That it is necessary to maintain reduction by means of a suitable apparatus, leaving the fingers entirely free.

3. That the patient must use the hand as soon as possible after union.

4. That massage fulfills but one indication, and must not be employed as the only means of treatment, except in those without displacement. Having no other pretension than the restoration of function after consolidation, its role becomes more restricted if the fingers are left at entire liberty during the treatment.—Railway Surgeon.

#### CROTON OIL FOR RINGWORM.

An epidemic of ringworm, of the variety *trichophyton megalosporon endothrix*, occurred recently in an orphan asylum, 48 out of 70 children being affected. Croton oil, which is a destructive rather than a curative agent, was employed. It requires to be carefully handled so as to regulate the amount of destruction, and never used for patches larger than a sixpence. It is necessary to first test the resistancy of the individual skin, hence a commencement is best made by applying a drop of oil, which it is well to remember exerts an effect beyond the spot to which it is applied; this is permitted to remain a few seconds, then vigorously wiped off with absorbent wool. By the degree of irritation produced upon the third, or even the second, day, one can form an idea of the degree of toleration, and in subsequent operations act in accordance therewith, permitting the drop to remain a longer or shorter time. A slight folliculitis is thus occasioned, and the procedure can be repeated, when, after the separation of the crusts, the inflammation has subsided. In this way the diseased hairs can be reduced to a continually diminishing number, and when these are only six or eight at most they can be de-

stroyed by electrolysis.—Annales de Dermatologie et de Syphilographie.

#### OBJECTIONABLE ADVERTISEMENTS.

It is amusing to read how wonderfully good some of our exchanges are in the matter of taking advertisements. They will take nothing which is not strictly ethical, whatever that means, and they strongly indorse everything advertised in their pages. The Philadelphia Polyclinic has ever been at the front in decrying certain forms of advertisements. In a late number the editor has a good deal to say on this subject, and adds that he advises all his readers to consult the advertising pages, for "It is our pride to admit nothing that is not meritorious." We did as we were told, and consulted these pages, to find there an advertisement of "A Specific Remedy" for the early and advanced stages of pneumonia! This is glad news, certainly. "Remarkable results" are obtained in tuberculosis and a host of other diseases; "also, in all forms of chronic disease, dependent in part or in whole on the want of oxygen in the vital fluids." We are a little rusty on just what constitute the "vital fluids," but we presume it refers to the gastric juice, or the cerebro-spinal fluid! The whole ad. is a first-rate newspaper one. Then, again, we notice a preparation which has been recommended by physicians for half a century as "The best and purest." "Physicians make no mistake in ordering this brand." While this may be as good as any other brand, yet it is hard to believe that it is the "best and purest." It is also gratifying to know now how we can be kept from making any more mistakes! In other words, the Polyclinic is no better than the rest of us. The whisky it advertises may be "the purest and best," but the few advertisements it contains are neither better nor purer than those of many other journals.—Journal Practical Medicine.

To those who anticipate a trip to New England the announcement of the opening of the Providence Line

June 3 will be hailed with delight. This popular route of the Providence & Stonington Steamship Company has always been the favorite way of travel to those people who wish to look upon travel as a pleasure rather than a bore. The steamers Connecticut and Massachusetts are among the handsomest on the Sound, and have the advantage of a main deck dining room, where passengers may while enjoying the cooling breezes of the Sound have the benefit of a first-class cuisine. A distinctive feature of this line enjoyed by none other is the cafe arrangement, where after the dinner is over a regular club service is in effect, such service as only the Providence Line can give, and of this service we must speak particularly, for the management makes it an imperative rule that all its employes observe the greatest politeness, and the courtesies of the company's captains and officers is proverbial. These little courtesies, generally denied the traveling public and which are strongly shown on this line, are one of the principal reasons of its success and popularity.

#### A NEW MEDICAL JOURNAL.

The Canadian Medical Review is the title of a new medical monthly published in Toronto, and edited by Dr. W. H. B. Aikins.

#### DR. MAILLOT.

A monument to the memory of the late Dr. Maillot is to be erected, and already the sum of 10,000 francs has been collected for it.

A new fuel made in France is of coal dust compressed into bricks and soaked with chemicals, which make it last a long time in a glow when once alight.

Massachusetts has also gone into the drug business, and its Board of Health has arranged to supply diphtheria antitoxin.

The London Daily Telegraph, of March 28, 1895, gives an account of Dr. De Bossy, who is in active practice at the age of 102 years.

A French physician who has written approvingly and at some length on bicycling for women believes that the training it gives to hand and eyes and muscles will make women walk better and carry themselves more gracefully and freely than they do. He has noticed that while a few women walk well and preserve a satisfactory balance, the effect is ruined by their indecision and uncertainty of movement at street crossings. Other weaknesses that are very prevalent among women in middle life are obesity and shortness of breath, and those, he believes, are to be overcome by riding the wheel.

Dr. John H. McCollom is to be appointed superintendent of the new Boston Hospital for Contagious Diseases attached to the City Hospital. Dr. McCollom is now bacteriologist to the Board of Health.

#### DOCTORS AND INCURABLES.

Reynold's Newspaper comes out with the declaration that physicians arrange with the friends of patients suffering from an incurable disease for the death of such patients. This is a curious charge which some of our English confreres seem to have taken seriously. For our part, it seems to us as if nothing could be more silly or more remote from the truth.

#### THE CHEMICAL COMPOSITION OF OYSTERS.

Mons. Chetin makes a report to the Academie de Medicine upon the chemical richness of oysters in bromine, iodine, fluorine and in phosphorus. Portuguese oysters contain a gramme of organic phosphate to the dozen. Ordinary European oysters contain one-third less. This statement in regard to the phosphatic richness of oysters will be a comfort to many oyster lovers, and may in a measure offset the unpleasant reports about the capacity of the oyster for nourishing tubercle bacilli.—N. Y. Med. Record.

The Congress of the Obstetric Society of France held a meeting in April last under the presidency of M. Gueniot. Dr. Gaulard discussed the subject of scarlet fever and the albuminuria of pregnancy. Other papers were read upon "The Causes of Puerperal Eclampsia," "The Grip in the Puerperal State" and upon "Abnormal Forms of Toxemia in Pregnancy." M. Queirel noted that in an epidemic of influenza 35 puerperal women had been affected. In all cases the influenza took the pulmonary form. There were no deaths from the disease nor any serious complications produced.

The French Society of Ophthalmology held its 13th session in Paris, May 6 to May 9. M. De Wecker made a report upon the use of large subconjunctival injections. He said that the injection of a drop of a solution of sublimate, one or two per cent. in strength, had no antiseptic effect. He injected an entire syringeful of solution of sublimate, 1 to 2000, and in ulcers of the cornea his results had been very surprising. The injections were good, he said, in infectious ulcers, but of no use in other forms.

Dr. John F. Hill, of Augusta, Me., will, it is said, be the Republican candidate for Governor of the State of Maine. Maine has already had one medical man as Governor, and he ruled the State well. We wish Dr. Hill success.

Dr. Harold C. Ernst has been appointed professor of bacteriology in the Harvard Medical School.

Dr. Theobald Smith, formerly chief of the Division of Animal Pathology in the United States Department of Agriculture, has been appointed bacteriologist of the Massachusetts State Board of Health and professor of applied zoology in Harvard.

The Legislature of the State of Rhode Island has recently passed an act for the regulation of the practice of medicine.
